

CERTIFIED SEEDS

Do not buy a pig in a poke

It pays to choose a good starting material. The purchase of certified seed guarantees you good germination and clean seed without undesirable species.

Nordic Seed's Seeds laboratory approved

Nordic Seed's Seed laboratory was approved in 2009 by the Danish AgriFish Agency to perform analysis for certification of seeds, including germination analysis, purity analysis and analysis of content of unwanted species.

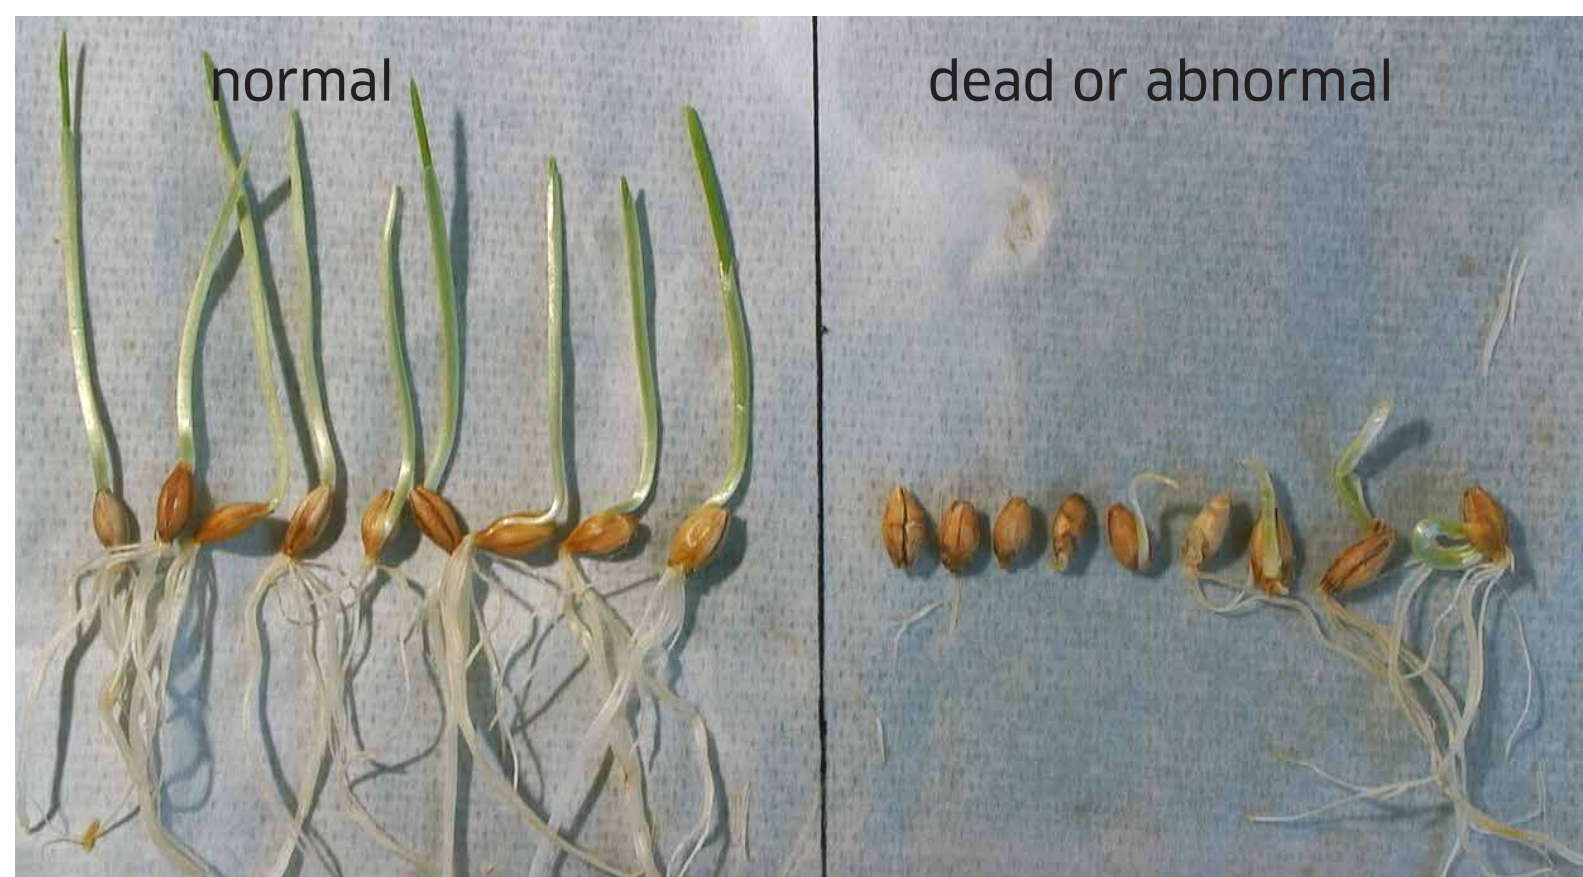

→ Germination

Kernels are counted and germinated in moist filterpaper.

It is evaluated if sprouts are normal or abnormal or if seeds are dead. Numbers in the different categories are counted.

Sprouts on paper.

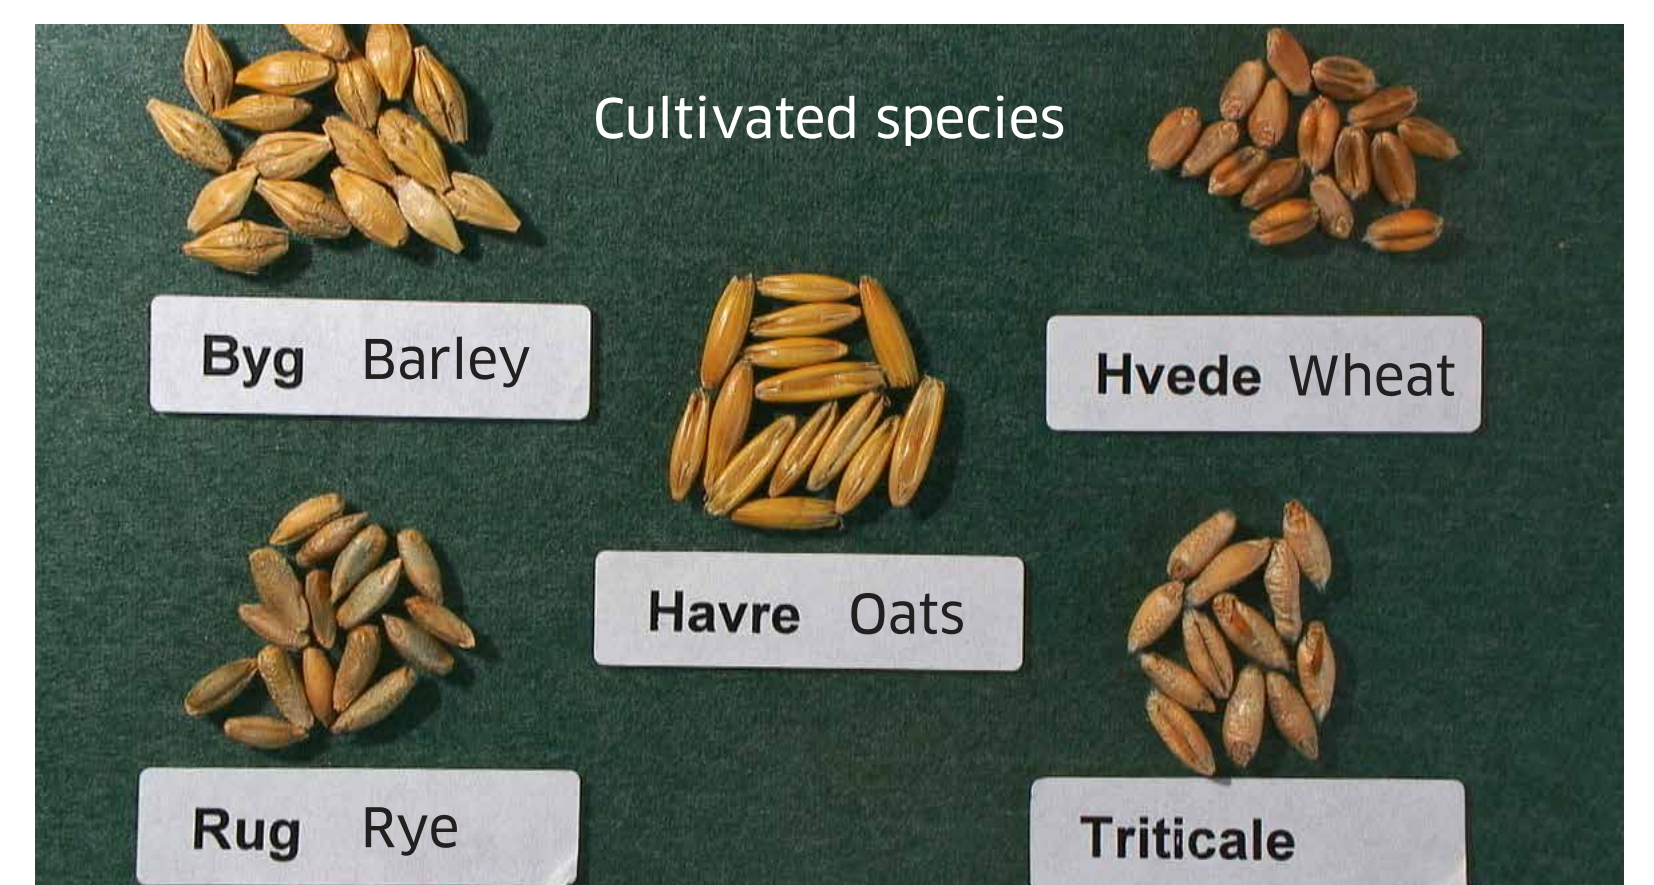

TZ analysis is a fast alternative to germination in paper.

→ Purity

A sample is classified into whole grains, waste and other species. The different categories are described and weighed and the percentage of pure seed is calculated.

→ Analysis for other seeds

A sample is analysed for the content of seeds of other cultivated species and seeds of weeds. The number of seeds of each of the possible detected species are counted.
